#### Introducing Bayesian Language models

Unigram, Bigram, Hidden Markov, & Topic models

Mark Andrews Psychology Department, Nottingham Trent University

> > July 16, 2017

#### Language data

▶ A *minimal* description of observed language data is as follows:

$$\mathcal{D} = \{w_1, w_2 \dots w_j \dots w_J\},\,$$

with

$$w_{j} = w_{ji}, w_{j2} \dots w_{jn_{j}},$$

and

$$w_{ji} \in \mathcal{V}$$
,

where  $\mathcal{V}$  is a finite vocabulary, which can be represented for simplicity by integers

$$\mathcal{V} = \{1, 2 \dots V\}.$$

- In other words, we can describe language data as a set of sequences of symbols.
- ► Each  $w_{ji}$  usually represents a word (but could represent e.g. phonemes, instead) and each  $w_j$  represents a text or sentence.

# Unigram probabilistic language model

- ▶ A *probabilistic language model* is any probabilistic generative model of the language data D.
- ▶ One of the simplest possible probabilistic language models is

$$w_{ji} \sim \operatorname{dcat}(\pi)$$
, for  $i \in 1, 2 \dots n_j$ ,  $j \in 1, 2 \dots J$ 

where dcat( ) represents a categorical distribution (probability mass function) over  $1\dots V$  with

$$Pr(w_{ji} = k) = \pi_k.$$

▶ In other words, we model each word  $w_{ji}$  as drawn independently from a single categorical distribution with parameters  $\pi$ .

#### Bayesian unigram models

- ▶ In any Bayesian model, we provide a full probabilistic account of all variables, including observed variables, parameters, etc.
- ► For the case of a probabilistic unigram model, a common Bayesian unigram model would be

$$\begin{split} \pi &\sim ddirichlet(\alpha),\\ w_{j\,i} &\sim dcat(\pi), \quad \text{for } i \in 1,2\dots n_j, j \in 1,2\dots J. \end{split}$$

- ▶ Here, ddirichlet() denotes a V-dimensional Dirichlet distribution, which is a probability distribution over V-dimensional probability mass functions. It has hyperparameters  $\alpha = \alpha_1, \alpha_2 \dots \alpha_V \dots \alpha_V$ , where each  $\alpha_V > 0.0$ .
- ► The Dirichlet distribution is commonly chosen in this context because it is a conjugate prior of the categorical distribution.

#### Dirichlet Distribution

► The Dirichlet distribution is

$$ddirichlet(\alpha) = \frac{\Gamma(\sum_{\nu} \alpha_{\nu})}{\prod_{\nu} \Gamma(\alpha_{\nu})} \prod_{\nu=1}^{V} \pi_{\nu}^{\alpha_{\nu}-1}$$

where

$$\frac{\Gamma(\sum_{\nu}\alpha_{\nu})}{\prod_{\nu}\Gamma(\alpha_{\nu})}$$

is the normalizing constant, i.e.,

$$\frac{\prod_{\nu} \Gamma(\alpha_{\nu})}{\Gamma(\sum_{\nu} \alpha_{\nu})} = \int \prod_{\nu=1}^{V} \pi_{\nu}^{\alpha_{\nu}-1} d\pi$$

### Dirichlet distribution hyperparameters

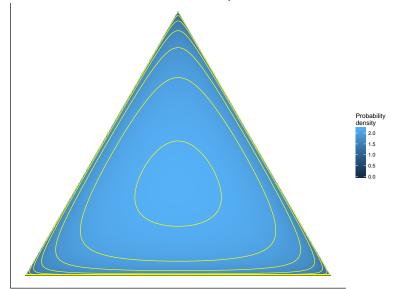

- As mentioned, the hyperparameters of a V-dimensional Dirichlet distribution is a V-dimensional vector  $\alpha$  of positive values.
- ▶ It is convenient to sometimes represent  $\alpha$  as follows:

$$\alpha = a \cdot m$$

where a > 0 is a scalar and m is V-dimensional probability mass function, i.e  $0 \le m_v \le 1$  and  $\sum_v m_v = 1$ .

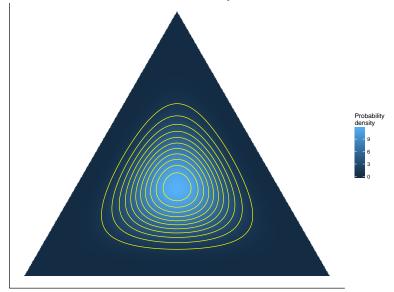

- ▶ In this reparameterization, m is a *location* vector and a is a *scale* vector. In other words, m is the centre of the distribution, and a indicates how spread out around the centre the distribution is. Also, m is exactly the average, or expected value of the distribution.
- ▶ Note  $a = \sum_{v} \alpha_{v}$ ,  $m = \alpha/a$ .

#### 3d Dirichlet distribution: Example 1

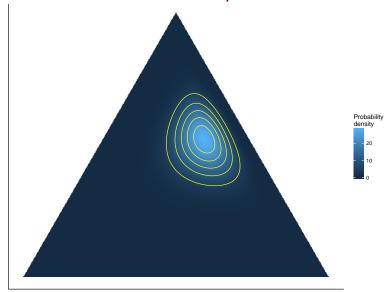

Here,  $\alpha = 1.1, 1.1, 1.1$ , or  $\alpha = 3.3$ ,  $m = [\frac{1}{3}, \frac{1}{3}, \frac{1}{3}]$ 

#### 3d Dirichlet distribution: Example 2

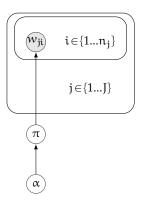

Here,  $\alpha = 5, 5, 5$ , or  $\alpha = 15$ ,  $m = [\frac{1}{3}, \frac{1}{3}, \frac{1}{3}]$ 

#### 3d Dirichlet distribution: Example 3

Here,  $\alpha = 5, 10, 15$ , or  $\alpha = 30$ ,  $m = [\frac{1}{6}, \frac{1}{3}, \frac{1}{2}]$ 

## Unigram model: Bayesian network

This is a *graphical model* or *Bayesian network*. It shows the conditional independence structure of the variables in the probabilistic model.

#### Posterior inference

Because the Dirichlet distribution is a conjugate prior to the categorical distribution, calculating the posterior distribution over π is possible algebraically:

$$\begin{split} P(\boldsymbol{\pi}|\boldsymbol{\mathfrak{D}},\boldsymbol{\alpha}) &= \frac{P(\boldsymbol{D}|\boldsymbol{\pi})P(\boldsymbol{\pi}|\boldsymbol{\alpha})}{\int P(\boldsymbol{D}|\boldsymbol{\pi})P(\boldsymbol{\pi}|\boldsymbol{\alpha})d\boldsymbol{\pi}}, \propto \prod_{\{j\mathbf{i}\}} P(w_{j\mathbf{i}}|\boldsymbol{\pi})P(\boldsymbol{\pi}|\boldsymbol{\alpha}), \\ &\propto \prod_{\nu=1}^{V} \pi_{\nu}^{n_{\nu}} \prod_{\nu=1}^{V} \pi_{\nu}^{\alpha_{\nu}-1}, \\ &\propto \prod_{\nu=1}^{V} \pi_{\nu}^{n_{\nu}+\alpha_{\nu}-1}, \\ &\text{ddirichlet}(\boldsymbol{n}+\boldsymbol{\alpha}). \end{split}$$

▶ In other words, given the prior  $ddirichlet(\alpha)$  and observed counts of  $n = n_1, n_2 ... n_{\nu}$  (i.e.,  $n_{\nu}$  is the number of observations of word  $\nu$ ), the posterior distribution is always  $ddirichlet(n + \alpha)$ .

# Unigram model of Moby Dick

```
data("stop words")
moby_dick <- gutenberg_download(2701)</pre>
word counts <- moby dick %>%
  unnest tokens(word, text, token = 'words') %>%
  anti_join(stop_words) %>%
  count(word, sort=TRUE)
# Make a (named) vector of counts
counts <- word_counts$n
words <- word counts$word
```

## Unigram model of Moby Dick

As a starting point, choose uniform prior

```
alpha <- rep(1, length(counts))</pre>
```

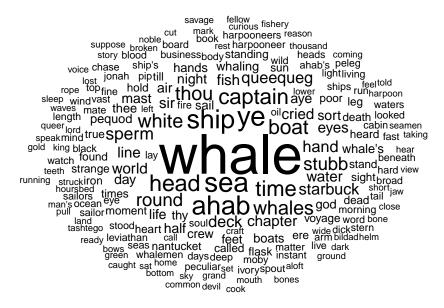

▶ Draw a sample from posterior distribution  $P(\pi|\mathcal{D}, \alpha)$ :

```
vpi <- sample.dirichlet(counts+alpha)</pre>
```

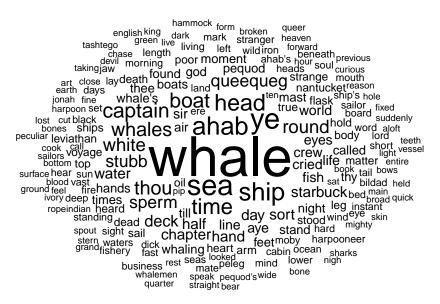

We can graphically represent this sample as follows

```
wordcloud(words = words, freq = vpi, max.words = 200)
```

### Sample from posterior distribution: Example 1

## Sample from posterior distribution: Example 2

## Sample from posterior distribution: Example 3

## Marginal likelihood

▶ The marginal likelihood is

$$\begin{split} P(\mathcal{D}|\alpha) &= \int P(D|\pi)P(\pi|\alpha)d\pi, \\ &= \frac{\Gamma(\sum_{\nu}\alpha_{\nu})}{\prod_{\nu}\Gamma(\alpha_{\nu})} \int \prod_{\nu=1}^{V} \pi_{\nu}^{n_{k}+\alpha_{k}-1d}d\pi, \\ &= \frac{\Gamma(\sum_{\nu}\alpha_{\nu})}{\prod_{\nu}\Gamma(\alpha_{\nu})} \frac{\prod_{\nu}\Gamma(n_{\nu}+\alpha_{\nu})}{\Gamma(\sum_{\nu}(\alpha_{\nu}+n_{\nu}))}. \end{split}$$

- ▶ It is the likelihood function of  $\alpha$ , and is marginalized (i.e. integrated) over  $\pi$ .
- ▶ We can treat this like any other likelihood function.

We can set the value of a to the value that maximizes the likelihood function. This is a type of *empirical Bayes* inference.

### Bigram models

- ▶ A bigram probabilistic language model for our observed language data 𝔻 is as follows.
- For  $1 \le j \le J$ ,  $w_{j1} \sim \operatorname{dcat}(\pi),$

$$w_{j\,i} \sim dcat(\theta_{[w_{j\,i-1}]}), \quad \text{for } 2 \leqslant i \leqslant n_j.$$
 where  $\theta$  is a  $V \times V$  matrix, and  $\theta_{Vu} \triangleq P(w_{i\,i} = u | w_{i\,i-1} = v)$ 

▶ In other words, for each sentence or text, we first sample the initial word for a categorical distribution. For the remaining words, we sample their values from a categorical distribution that is conditioned on the previous word.

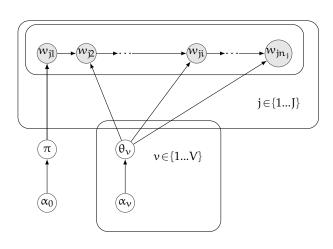

### Bayesian Bigram model

- For a Bayesian version of a bigram model, we provide priors on  $\pi$  and θ.
- ► Common choices are Dirichlet distributions

$$\begin{split} \pi &\sim ddirichlet(\alpha_0),\\ \theta_{\nu} &\sim ddirichlet(\alpha_{\nu}), \quad \text{for } 1 \leqslant \nu \leqslant V,\\ w_{j1} &\sim dcat(\pi),\\ w_{ji} &\sim dcat(\theta_{w_{ji-1}}), \quad \text{for } 2 \leqslant i \leqslant n_j. \end{split}$$

Note that here we have a separate  $\alpha_{\nu}$  prior for each conditional distribution  $\theta_{\nu}$ . Other options are possible.

# Bigram model Bayesian network

#### Posterior inference

► The posterior distribution over  $\theta_{\nu}$  is similar to the case of the posterior inference in Dirichlet distributions in the unigram case, with the difference being that the relevant *counts* are

$$R_{\nu} = R_{\nu 1}, R_{\nu 2} \dots R_{\nu u} \dots R_{\nu V}$$

where  $R_{\nu u}$  gives the number of times word u follows word  $\nu$  in the corpus.

► As such,

$$P(\theta_{\nu}|\mathcal{D}) = ddirichlet(R_{\nu} + \alpha_{\nu})$$

▶ For the posterior over  $\pi$ , we can use the marginal count vector  $\mathbf{r}$ , where  $\mathbf{r}_{\nu}$  simply gives the frequency of occurrence of word  $\nu$ :

$$P(\pi|\mathcal{D}) = ddirichlet(r + \alpha_0)$$

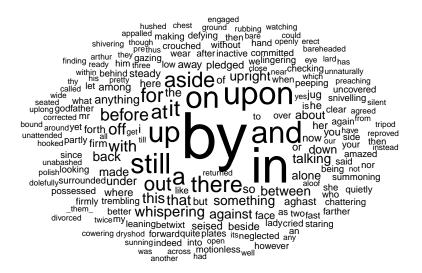

# Bigram model of collected works of Charles Dickens

```
dickens_books_id <- gutenberg_works(</pre>
  author == "Dickens, Charles")$gutenberg_id
dickens books <- gutenberg download(
  dickens_books_id, meta_fields = "title")
dickens words <- dickens books %>%
  unnest tokens(word, text, token = 'words') %>%
  count(word, sort=TRUE)
dickens_bigrams <- dickens_books %>%
  unnest tokens(bigram, text, token = 'ngrams', n=2) %>%
  count(bigram, sort=TRUE) %>%
  separate(bigram, c('word1', 'word2'), sep=' ')
```

# Sample from posterior distribution of $\theta_{dear}$

# Sample from posterior distribution of $\theta_{stand}$

### Sample from posterior distribution of $\theta_{tall}$

## Simulations from a bigram model

- ▶ We can generate data from a trained bigram model as follows:
- ▶ First, we sample from the posterior distribution  $P(\pi|D, \alpha_0)$ , and then sample  $w_1$  from  $dcat(\pi)$ .
- ▶ We then sample from  $P(\theta_{[w_1]}|\mathcal{D}, \alpha_{[w_1]})$ , and sample  $w_2$  from  $dcat(\theta_{[w_1]})$ .

## Simulations from a bigram model: Examples 1-3

- admirable lady acknowledged supremacy and then i might think that ought to whom she once not your time organist ought to divine who had folded up to mutter among them a level of the next morning three j linton bespeckled prospect the knocker marley's slushed and defarge as mr jaggers
- curtains wherever he took deadly cold arch wore itself but i would have we my own face was quite necessary to wear this couplet about two pair of saying that in his vigorous play with an arm round upon that the real military life may be an eye these walls
- constantinopolitan chamber straight before they looked at enormous hit with me steerforth as they called him with the people live in it to night if he had entered according to do sit thee get'st tobacco post in germany and of characteristics of beasts and slept and no idea good part

### Simulations from a bigram model: Examples 4-6

- only ended the duke has lost to this little tavern he has been careful of the door and present seat mr pickwick after making expiation for this three quarters over an angry sultan pomp about the plan of all appearance of yesterday i shut lest he covered with love the
- name as if they came to contribute to his gloved hand would be such a positive intelligence when he had insisted that he did not quite a wry faces clustering pillars strong alliance but she could not that it formed into the other side with me we find yourself to
- ▶ most distant corner of oh cap'en cuttle walked forth against me but whom he opened from view to him what provision to cast off a little cage in every fresh discussion fledgeby you do it the expression of the house where he observed to giving me and with this woman

### Simulations from a bigram model: Examples 7-9

- boot cleaning for i would have so i had not set of course though it had come upon her and all very near your heart which i don't you should disparage my dear rogues you to a bar and full sincerity he much tickled in the mother and more money
- ▶ restless too much satisfaction of breath folding up directly in one of the obstinacy reputation and of us for i may derive from the third in all the regular in the park the top of the correction of that the change in reduced and find him and believe i should
- ▶ penalty then drank bitter laughs i need keep up into the confederation observes when i cannot come at the old curiosity out in reference to come to appear asleep what's her rosy cheeked charmers with great that the seat till now don't know that had said she gave some horrible

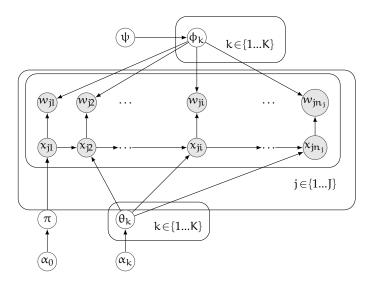

#### Hidden Markov model

- ▶ A Hidden Markov model is a type of latent variable model.
- ▶ It assumes that observed data are generated by sampling from categorical distributions that are indexed by a latent (hidden) first order Markov chain of state variables.
- ► The cardinality of the state variable, denoted by K here, is a modelling choice.
- ▶ As a probabilistic language model for our  $\mathcal{D}$ , a Hidden Markov model is a follows: For  $j \in \{1 ... J\}$ ,

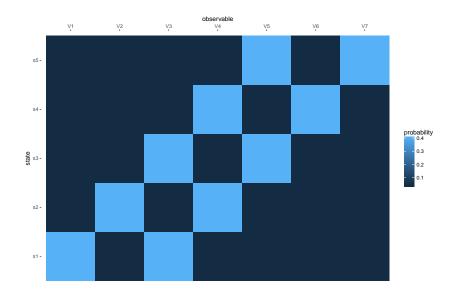

$$\begin{split} &x_{j1} \sim dcat(\pi), \\ &x_{ji} \sim dcat(\theta_{\lfloor x_{ji-1} \rfloor}), \quad \text{for } 2 \leqslant i \leqslant n_{ji}, \\ &w_{ji} \sim dcat(\varphi_{\lfloor x_{ji} \rfloor}), \text{for } 2 \leqslant i \leqslant n_{ji} \end{split}$$

- ► Here,  $\theta$  is a K × K matrix, with  $P(x_{ji} = l | x_{ji-1} = k) = \theta_{kl}$ .
- ► The  $\phi$  is a K × V matrix,  $P(w_{ji} = v | x_{ji} = k) = \phi_{kv}$ .
- ► We put Dirichlet priors on  $\pi$ ,  $\theta$ ,  $\phi$ .

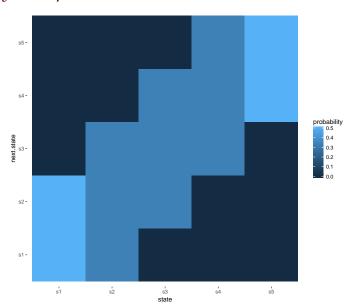

# Hidden Markov model Bayesian network

# Toy example: ф

# *Toy example:* $\theta$

#### Posterior inference

- ▶ We usually will use Dirichlet priors on  $\pi$ ,  $\phi_1$ ,  $\phi_2$ ... $\phi_K$ , and  $\theta_1$ ,  $\theta_2$ ... $\theta_K$ .
- ► However, the posterior distribution

$$P(\pi, \phi, \theta | \mathcal{D})$$

is not analytically tractable.

- ▶ In this situation, we use Monte Carlo methods to draw samples from this posterior distribution.
- ▶ For this, we may use a *blocked Gibbs sampler* such where we iteratively draw a sample from the posterior distribution of the latent state space, assuming values for the parameters, and then from the posterior over the parameters, assuming values for the state space:

$$\begin{split} \tilde{x} \sim P(x|w,\tilde{\pi},\tilde{\varphi},\tilde{\theta}),\\ \tilde{\pi},\tilde{\varphi},\tilde{\theta} \sim P(\pi,\varphi,\theta|w,\tilde{x}) \end{split}$$

#### State space inference

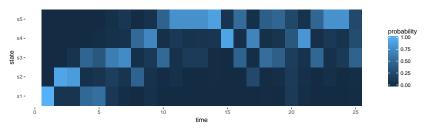

- ▶ Given a sequence of observations  $w_1, w_2 ... w_n$ , what is the probability distribution over the possible values of  $x_1, x_2 ... x_n$ ?
- Assuming we know  $\pi$ ,  $\varphi$ ,  $\theta$ , we can use recursive inference as follows:

$$P(x_{i}|w_{1}...w_{2}) = \frac{P(w_{i}|x_{i})P(x_{i}|w_{1},w_{2}...w_{i-1})}{\sum_{\{x_{i}\}}P(w_{i}|x_{i})P(x_{i}|w_{1},w_{2}...w_{i-1})},$$

$$\propto P(w_{i}|x_{i})\sum_{\{x_{i-1}\}}P(x_{i}|x_{i-1})P(x_{i-1}|w_{1},w_{2}...w_{i-1})$$

## State space inference in toy example

► Given the observed values — 4, 2, 4, 3, 3, 5, 5, 4, 6, 5, 7, 5, 5, 7, 6, 5, 4, 5, 5, 1, 6, 5, 7, 5, 3 — the inferred values of the states are:

► The actual values of the state trajectory are: 1, 2, 3, 3, 3, 4, 5, 4, 4, 5, 5, 5, 5, 5, 5, 4, 3, 2, 3, 3, 4, 3, 2, 3, 3.

#### Latent Dirichlet Allocation

- ► Latent Dirichlet Allocation is a probabilistic bag-of-words language model.
- ▶ It is a type of multilevel/hierarchical probabilistic mixture model.
- ▶ It is defined as follows: For  $1 \le j \le J$ ,

$$\pi_j \sim \text{ddirichlet}(\alpha), \quad \text{for } 1 \leqslant j \leqslant J,$$

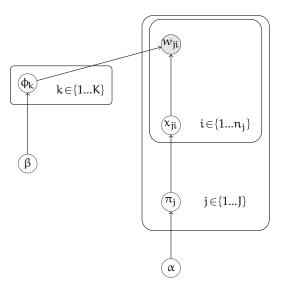

and for  $1 \leqslant i \leqslant n_{ji}$ ,

$$x_{ji} \sim dcat(\pi_j),$$
  
 $w_{ji} \sim dcat(\phi_{[x_{ji}]})$ 

- ▶ The cardinality of  $\phi$  is a modelling choice.
- ▶ As such, we treat each document j as a sample from a probabilistic mixture model, where the component probabilities are  $\pi_j$ , which are sampled from a Dirichlet distribution.

#### Latent Dirichlet Allocation Bayesian network
